

WinTi is a versatile on-line card payment processing system developed for use where authorisation of transactions is required at the point of sale or point of order entry. WinTi is suitable for use in both cardholder present and cardholder not present situations.

Ideal for a variety of busy working environments including high street retail, hospitality, call centres and e-commerce, WinTi offers one of the most efficient and secure ways of gaining card authorisation and payment.

WinTi has won universal acclaim for its reliability, flexibility and ease of use. It is so versatile that it can be configured to offer your business choices in terms of when and how quickly your card authorisations and settlement takes place.

Easily installed as a stand-alone manual key entry system or interfaced to an existing system, to allow seamless background processing of card payments, WinTi is the fast, efficient and versatile way to gain card authorisation and payment.

How does WinTi work?

WinTi is a 32-bit Windows application, which will operate on MS Windows 98 or higher.

WinTi essentially comprises two modules – WinTi Client, a front end operator interface for data entry and authorisation response display and WinTi Server, a core processing module for transaction verification and communication handling.

For companies with existing systems, the WinTi Server can be integrated directly without needing to install WinTi Client. Integration methods include shared text files or an IP socket interface to enable communication between the host system and WinTi.

Upon processing of card data via the WinTi Client or front end system, WinTi Server obtains authorisations quickly, efficiently and securely, providing comprehensive management information each and every step of the way.

- > Versatile solution for high street retail, hospitality, call centres and e-commerce.
- > Can be integrated with your existing sales order processing system.
- > Secure utilises address verification (AVS) and card security code (CSC) validation.
- > Able to support multiple merchant account processing, corporate purchasing cards and multi-currency processing.
- > Fast transaction authorisation as little as four seconds.
- > Remote diagnostics and telephone support available seven days a week.

Versatile and efficient

By utilising shared communications resources and supporting simultaneous authorisation of transactions with up to 16 communication channels, WinTi can meet even the most demanding of on-line authorisation requirements.

WinTi can be used across local and wide area networks, supporting up to 10,000 standard operator interface modules with WinTi Client. The system complies with all common communication methods including PSTN, ISDN, Paknet and X.25 (the fastest authorisation network available) to offer you the most efficient method of authorisation and funds transfer for your communication infrastructure.

Whether you want to authorise and transfer funds at branch, regional or head office level WinTi is the solution. For total support, WinTi can also support data polling using Commidea's own bureau service.

Able to support multiple merchant account processing, corporate purchasing cards and multi-currency processing, WinTi is the versatile and efficient card payment processing system that you've been looking for.

Safe and secure

Like all systems from Commidea, WinTi is supported by the latest security measures to help combat fraud by offering address verification (AVS) and card security code (CSC) validation.

Management Information

The auditability of any financial software is paramount, WinTi offers a complete and comprehensive reporting system that backs up the entire lifecycle of each transaction from data input through to delivery to the acquirer. Reports are available to view on screen, print to hard copy or import into other applications, providing you with the vital information you need to successfully run your business.
